Your Answers:

1 0 / 1 point Multiple choice

What makes topic detection more difficult for longer text compared to short text?

✕ Longer texts have more variation in words to express topics

Correct Answer: **Longer texts such as news may contain different topics which creates ambiguity.**

- Longer texts provide more details than shorter texts about a topic
- Longer texts such as news may contain different topics which creates ambiguity.
- Longer texts such as news have stronger opinions than shorter texts

2

1 / 1 point Multiple choice

Why is it so difficult to agree on a set of universal topics?

- There is a limited set of topics but there are many different ways to describe them.
- There is too much variation in the keywords that can be extracted from topics.
- Topics are subjective categories and both the world and our view on the world changes continuously.
- Topics are based on the keywords that are different from text to text.

3

1 / 1 point Multiple choice

What is the most important difference between topic modelling and text categorisation?

- Topic modelling is hierarchical and text categorisation is not.
- For text categorisation the topics are given whereas topic modelling does not assume an a priori definition of topics.
- Text categorisation uses key words and topic modelling uses complete texts.
- Topic modelling is more fine-grained than text categorisation.

4

0 / 1 point Multiple choice

What determines the level of granularity when assigning topics to a text?

- Topics should be fine-grained to capture all details

Correct Answer: **Depends on data usage and specific application**

- The number of topics is always fixed and does not vary
- Topics should be coarse-grained to capture only main topics
- Depends on data usage and specific application

5

1 / 1 point Multiple choice

At what unit level can a topic be assigned in topic modeling or classification?

- Short texts
- Complete books
- ✓ All of the above
- Sentences

6 1 / 1 point Multiple choice

Which of the following is **not** a disadvantage of supervised topic classification?

- Manual effort is required to maintain the topics and training data
- ✓ Control over the topics
- The results can be biased towards the distribution of training data
- New topics that are not in the training data cannot be detected

7 1 / 1 point Multiple choice

What approach is commonly used to label clusters in topic modeling?

- Using the most frequent words across all clusters as labels for each individual cluster
- Random words from each cluster are chosen as labels
- Domain experts manually assign labels based on the most relevant terms in each cluster
- ✓ Extracting the most distinctive keywords from the clusters using techniques like TF-IDF

8 1 / 1 point Multiple choice

Why is random initialization and internal sampling considered a limitation in Latent Dirichlet Allocation (LDA)?

- ○ Random initialization and internal sampling are not considered a limitation in LDA
- ○ It leads to overfitting, making the model less generalizable
- ✓ ● It can lead to unstable topic modeling results
- ○ It makes LDA computationally inefficient

9 1 / 1 point Multiple choice

What is catastrophic forgetting during fine-tuning?

- ○ The ability of a model to learn multiple tasks during fine-tuning
- ○ The ability of a model to remain effective with little data available for fine-tuning
