Attempt 2	16 of 20	80%	(Highest score)

Your Answers:

1

1 / 1 point Fill in the Blank

How do you check in which directory you are?

pwd

2 1 / 1 point Fill in the Blank

What command do you use to go to your home dir from anywhere in the system?

`cd`

3 1 point possible Essay

What effect does pressing the 'tab' key have when you are typing in filenames or commands on the command line?

autofills (for example if I type "Doc" and press tab, then it autofills to "Documents")

4 1 / 1 point Fill in the Blank

What command can you use to create a new directory named NEWDIR?

`mkdir NEWDIR`

5 1 / 1 point Fill in the Blank

You want to find the occurrences of "cat" in a text file that may have capitals in them. What command can you use to find occurrences of "cat", "Cat", "cAt" etc in a text file?

`grep -i "cat"`

6 1 / 1 point Fill in the Blank

What command would you use to append the last 6 lines of file 'input' to the already existing file 'output'?

`tail -n 6 input >> output`

7

1 point possible Essay

Explain what the difference is between a command option and an argument and give an example of each.

"Option" modifies how a command behaves (usually starts with "-")

"Argument" is the input the command acts on (like a file or text)

Example: `grep -i "cat" file.txt`

`-i` is the option (ignore case)

`"cat"` and `file.txt` are the arguments

8

1 / 1 point Fill in the Blank

What command would you use to execute the script `run.sh`? (HINT: the extension `.sh` indicates that this is a bash script)

`bash run.sh`

9

0 / 1 point Fill in the Blank

What command would you use to remove all files in the current directory that both start with `temp` and end in `txt`? (note that both conditions need to be fulfilled, so a file named `temp.pdf` should not be deleted)

`rm temp&txt`

Correct Answer: `rm temp*txt`

10

1 / 1 point Fill in the Blank

What does the Python interpreter prompt look like (this tells you whether you are in the bash shell or in Python)

`>>>`

11

1 / 1 point Fill in the Blank

How would you create a list in Python named 'wine' that contains the elements 'beaujolais', 'rioja' and 'champagne'?

```
wine = ['beaujolais', 'rioja', 'champagne']
```

12

1 / 1 point Fill in the Blank

In the previous question, you generated a Python list called 'wine' that contains three elements. How do you print the first element of this list?

```
print(wine[0])
```
